Geotechnical Consultation
Vegetation Management, View Corridor
Morningview East Residential Plat
Greenbelt Area - 139th/140th Avenue East
Pierce County, Washington
Job Name: AmbrosiaHm.MorningviewEast.L

Based on our recent site visit and observations, the larger vegetation located on the steep slope areas at the site may be managed to improve the view corridor for the residents above. Proper management of the taller vegetation also improves slope stability. The reduction of the height of the taller vegetation reduces the risk of wind-sail effects and the related soil disturbances. This would include the alder, maple and cottonwood trees, as well as the taller brush. The goal is to promote the growth of the underlying grass and brush, and maintain a dense vegetative cover on the sloping ground surface. This is typically accomplished with hand operated or track-mounted machinery with an extended reach. The stumps should be left in place. For best results, we recommend that the alder and maple stumps remain between 5 and 10 feet in height, as this will promote rapid growth. The lower growing vegetation should be left intact. The debris should be removed from the slope area in a manner that limits any surface disturbance. Where the surface area is disturbed, it should be restored using conventional erosion control measures. Typically this includes jute matting or other approved ground cover.

We trust this is sufficient for your current needs. Should you have any questions, or require additional information, please contact us at your earliest convenience.

Respectfully submitted,
